

Getting Started

HotelAir is carefully well thought UI frame work that is built on top of React & Bootstrap5, This part of the doc will help you to quickly start your project and will you a basic idea about how HotelAir work.

Installation

To set up a project with React

1. Create a project folder and setup npm. We'll create the my-project folder and initialize npm with the -y argument to avoid it asking us all the interactive questions.
2. **Install NPM** Unlike our Webpack guide, there's only a single build tool dependency here. We use --save-dev to signal that this dependency is only for development use and not for production.

```
npm i
```

3. **Npm Run Start** Project Run In Local Apply command

```
npm run Start
```

4. **Npm Run Build** Project Code Build Apply this command and upload in to server to build folder code

```
npm run build
```

Project structure

node_modules (NPM dependencies (by default the folder is not included) **npm** installs dependencies.)

```
src
├── assets
│   ├── fonts
│   ├── images
│   └── scss
├── Common
├── Layout
│   ├── AdminLayout
│   └── AuthLayout
├── Partial
│   ├── MyProfile
│   ├── Reports
│   ├── RoomsSettings
